

Controlled field-of-view ladder: appearance, modality and pixel size held fixed, scale swept
each backbone restricted to the pairs it registers at native field of view; error bars are 95 % Wilson score intervals (left) and 95 % bootstrap percentile intervals (right)

[†] the fine-tuned backbone was trained on 131 of the 187 benchmark pairs, most of this testbed included; its curves are a within-training reference, not a held-out result.
